

# Cell Count

**The CIS Cell Count Service helps pin point the high cell count cows in the herd to avoid penalties.**

Cell Count monitoring is important because if the number of somatic cells increases, milk yield is likely to fall. This is primarily due to the damage of milk-producing tissue in the udder caused by mastitis pathogens and the toxins produced, particularly when epithelial cells are lost.

## **CIS Cell Count service includes:-**

- Postal service for samples to help keep costs to a minimum
- Collection service available using one of the CIS Milk Recorders to take samples and deliver to the lab
- Results turned round within 48hrs
- Butterfat & protein analysis included upon request
- Paper reports available by fax or post
- Reports available online to view from mobile, tablet or desktop
- SMS alert to mobile when results published online
